

Heating hoses – heated wires

The heating hoses are an ideal solution in many various technological processes where fluid or gaseous materials need to be conveyed flexibly and without any temperature loss.

Cato-Tech A/S provides a broad choice of designs for outer protection jackets of heating hoses.

The outer protection jacket of the heating hose is designed and built to suit a wide range of temperatures, various capacity of the operating equipment and other applications.

Analyzing processes such as water combustion, engine exhaust measuring and also other applications used in the refineries and chemical industry. The gaseous substances are released from the outlet to the measuring equipment, where the gases are kept frost-free and protected against condensing. The temperature during these processes is maintained at approx. 200-250° Celsius.
